Description

Hiren's BootCD PE (Preinstallation Environment) is a restored edition of Hiren's BootCD based on Windows 11 PE x64. Given the absence of official updates after November 2012, the PE version is currently under development by the fans of Hiren's BootCD. It includes a carefully chosen set of the best free tools, designed for modern computers that support UEFI booting and need at least 4 GB of RAM.

Equipped with these invaluable tools, you can address various computer-related problems. Notably, it does not include any pirated software; instead, it exclusively contains free and [legal](#) software.

If your computer does not support a regular Windows 11 installation, it will likely boot with the Windows 11 PE version, as Windows PE versions have significantly lower hardware requirements. For instance, if your computer boots with the Windows 10 PE version, it is highly probable that it will also boot with the Windows 11 PE version.

Upon booting, the PE version attempts to install drivers for essential components such as graphics, sound, wireless and Ethernet cards for your hardware, facilitating connection to a WIFI or Ethernet network. If your WIFI or Ethernet card is not recognized by the PE version, kindly [Contact Us](#) with your hardware model. We will strive to incorporate the necessary drivers in upcoming releases.

Official releases are still available on our [Old Versions](#) page and additional information can be found on the About page. Please check the [About](#) page for more details.

Install

You can follow the steps below prepared in the Rufus utility to boot Hiren's BootCD PE from a USB flash drive. For maximum compatibility on older computers, we recommend using MBR as the Partition Scheme and FAT32 as the File System (Large FAT32 for USB flash drives equal or larger than 32 GB).

If you desire to manually partition or format your USB Flash drive, follow the steps outlined in the "How can I manually partition / format my USB Flash drive?" section on our HOWTOs page. In case your USB flash drive is corrupted for any reason, attempt the steps provided under the heading "My USB flash drive is corrupted. What steps can I try to fix it?" on the same page.

Download Rufus

Insert the USB flash drive you want to prepare into your computer. Download Rufus v4.5 x64 (or x86) and open Rufus.

Activate Dual UEFI/BIOS mode

With Rufus open, press ALT+E to activate Rufus's "Dual UEFI/BIOS" mode.

(This mode is initially inactive within Rufus. Ensure that the message "Dual UEFI/BIOS mode enabled" appears at the bottom of the program. After activating the "Dual UEFI/BIOS" mode, the setting is saved in Rufus's configuration so you won't need to enable it each time).

Note: Please activate the "Dual UEFI/BIOS" mode first and then select the ISO file. Otherwise, the FAT32 format cannot be selected within Rufus.

Select iso File

After activating the "Dual UEFI/BIOS" mode, select your USB flash drive from the "Device" list (or ensure it is selected correctly) and choose the HBCD_PE_x64.iso file by clicking the "SELECT" button.

- Choose Partition Scheme and File System
- Choose "Partition scheme" as "MBR" and "File system" as "FAT32".

Note: For USB flash drives equal or larger than 32 GB, choose "Partition scheme" as "MBR" and "File system" as "Large FAT32". If the "Large FAT32" option is not visible in Rufus, please press the ALT+L key combination to enable "Force Large32 formatting".

Set Label and Process

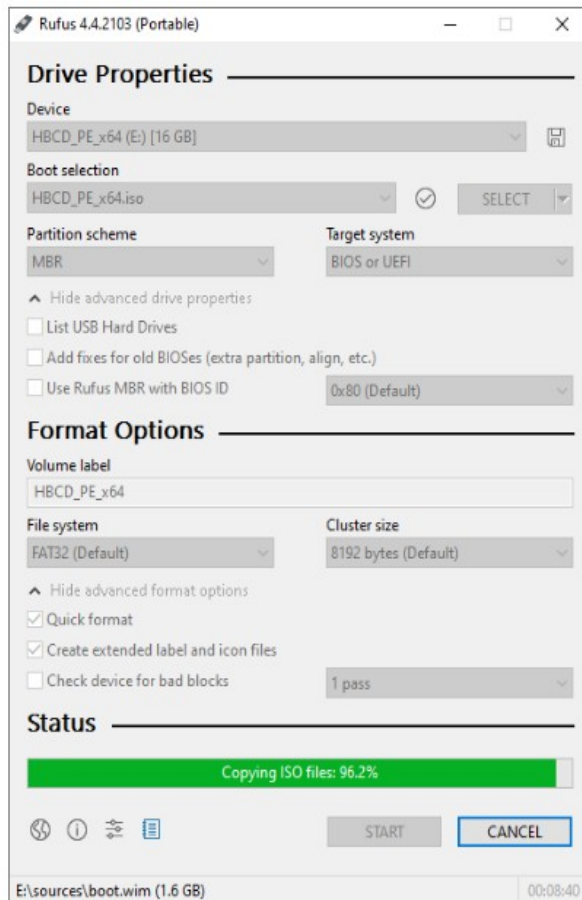

Enter an appropriate label for your USB flash drive in the "Volume label" field.

You can refer to the screenshot below for all the settings.

Click the "START" button and if the warning message is acceptable to you, begin the preparation process by clicking "OK".

Note: In newer versions of Rufus (4.6 and later), please ignore the "Revoked UEFI bootloader detected" warning by clicking "OK" and proceeding with the USB flash drive creation.

The preparation process may take approximately 10 minutes, depending on the write speed of your USB flash drive.
